...Top Ten Driest Summer In Some Parts Of West Central And Southwest Florida...

As is typical during the summer thunderstorm season across west central and southwest Florida, rainfall amounts since June 1 have been highly variable ranging from as little as 10 to over 30 inches. This is mainly due to the variability of thunderstorms and how one location can receive a couple of inches of rain from a storm while another just a short distance away will miss the storm and receive none. Another factor is that for several days this summer we had a southwest to west flow setup which favors the east coast of the Florida Peninsula for afternoon and evening thunderstorms.

RAINFALL JUNE THROUGH AUGUST

In a normal year about half of our yearly rainfall falls during the three months of June, July and August, and if you include September it increases to between 55 to 67 percent of the yearly total. With rainfall amounts falling short of normal in many areas the upcoming dry season could see a quick onset of drought conditions. This is already evident in the latest drought monitor which has some D0 (abnormally dry) conditions for parts of the Tampa Bay area. However, D0 is not considered drought. D0 is best used to describe conditions prior to drought developing or conditions coming out of a drought where there are lingering concerns.

This year a few climate locations ended up in the top ten driest summers (June/July/August). The top ten for these sites is listed in the following tables, along with the 2014 total, and the Normal Summer rainfall. There are also some other stats that list the June, July and August 2014 rainfall totals and ranking for that month if it was in the top twenty wettest and/or driest.
